Screwplug Heaters - CX

Application

Screwplug heaters are primarily used to heat liquids in tanks or vessels. To do so safely and reliably requires that the heating elements remain fully immersed in the liquid. Liquids such as water, oils, trichlorethylene, etc. can be heated through natural convection currents created by the immersed elements.

Although electricity costs are generally higher than gas or oil, it can be demonstrated that a Caloritech™ immersion heater is often your best choice. The electric heater provides close to 100% efficiency, is safer and easier to control and is usually cheaper to install.

Terminal Block Simplifies Wiring

All thermostat equipped screwplug heaters with moisture or explosion-proof housings feature a convenient terminal block mounted to a slide out trolley.

This unique Caloritech™ feature simplifies installation and reduces maintenance.

Installation

Listed heaters have standard 1" to 2 1/2" NPT tapered plugs. Any other size or type of plug is available on special order. The heater is installed through a threaded half coupling located in the vessel wall well below the minimum liquid level but spaced sufficiently above the bottom to allow for sludge build-up which should never be allowed to cover any part of the elements.

Horizontal installation is preferred even though heater replacement will require draining of the tank. Vertical installation is sometimes possible but it is best that you contact the factory for advice prior to purchase.

Operation

For an immersion heater to transfer heat it must establish a balance between convection currents and the temperature difference between itself and the liquid. Viscous liquids which retard convection currents are the most difficult to heat. Care must be exercised to ensure that the required rate of heat transfer from the heating elements is achieved without overheating the element and the liquid resulting in coking. This is generally achieved through the selection of heater watt density.

Heaters immersed in liquids, such as water with high calcium and magnesium content, phosphates or eluate solutions, have a tendency to precipitate their solids over the elements on heating. These heaters require scheduled maintenance to remove scale build up which may thermally insulate the elements and reduce their service life.

Selection

Proper selection of the screwplug heater is required to maximize service life. Once the wattage requirement is established decide on heater voltage and phase. Remember that unrealistic heat-up time requirements will increase equipment and operating costs.

The tables list, under "watt density", the required heat transfer rate from the various heaters. Refer to Section D of the Caloritech™ catalog for guidance on the acceptable watt density for your application. If a heater is not listed with the density you require we can fabricate to suit.

Of equal importance is the selection of the materials of construction which will resist corrosion and not wear away or contaminate the liquid. Refer to the corrosion guide in Section D for a list of the standard materials for various solutions. Also see page B26 for discussion on watt density.

The heaters are not guaranteed against corrosion since Thermon Heating Systems has no control over the liquid type, concentration or temperature of the solution. Consult your factory representative or your chemical supplier for recommendation on materials for your solution. Recommendations are not implied guarantees.

Warning - Fire Hazard

The heaters listed in the catalog may occasionally malfunction in normal use and if operated in the presence of explosive or combustible materials may cause fires. Do not operate in the presence of explosive or combustible materials. Observe fire prevention precautions and consult the local sales office or contact Thermon Heating Systems for proper application and installation instructions.

The thermostat controls function as temperature controls. Because they do not fail safe, an approved temperature and/or pressure safety control may be required for safe operation. Inclusion of consumer warnings on assembled products containing these elements and thermostats is recommended.

Heaters with 1" and 1 1/4" Plugs

Application

Type CXC heaters are used primarily for water heating and have brass screwplugs and copper sheaths.

Type CXF are used primarily for oil heating and have steel screwplugs. Low watt density heaters are used in heavier, non-circulated oils. Higher watt density heaters are suitable for light oils or in forced oil circulation loops. Incoloy® elements are silver brazed into a steel screwplug.

Built-in Thermostats

Standard built-in thermostat is a one pole device limited to 240V 25 amp. Whenever the heater voltage exceeds 240V or the heater current exceeds 25 amps or for three phase supply, the thermostat is intended for pilot duty only and is not factory wired to the elements. See Section F of the Caloritech™ catalog for selection of the contactor and control transformer you may require in these instances.

Heaters with 2" and 2 1/2" Plugs

Application

Type CXC heaters are used primarily for water heating and have brass screwplugs and copper sheaths.

Type CXF are used primarily for oil heating and have steel screwplugs. Low watt density heaters are used in heavier, non-circulated oils. Higher watt density heaters are suitable for light oils or in forced oil circulation loops. Incoloy® elements are silver brazed into a steel screwplug.

Type CXI heaters are used primarily for heating mildly corrosive solutions and use higher density Incoloy® elements welded into a stainless steel screwplug.

Built-in Thermostats

Standard built-in thermostat is a one pole device limited to 240V 25 amp. Whenever the heater voltage exceeds 240V or the heater current exceeds 25 amps or for three phase supply, the thermostat is intended for pilot duty only and is not factory wired to the elements. See Section F of the Caloritech™ catalog for selection of the contactor and control transformer you may require in these instances.

Unit with explosion-proof housing and adjustable thermostat

Special Features

(Check Factory)

Heaters With Built-in Thermostats

All screwplug heaters listed are available with built-in thermostats. Heaters with thermostats have a "T" added to their catalog no. prefix. Standard thermostat range is 50°F to 250°F (10°C to 120°C). Ratings are normally 25 amps at 240V single pole single throw. 600V thermostats and double pole thermostats are available on special order.

Special Thermostat Ranges

Thermostats with the following temperature ranges are also available upon request:

- 0°F to 100°F (-18°C to 40°C)
- 150°F to 550°F (70°C to 280°C)
- 300°F to 700°F (150°C to 370°C)

Terminal Housings

Shown below are the different types of terminal housings used with screwplug heaters.

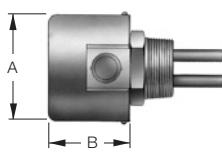

Figure 1

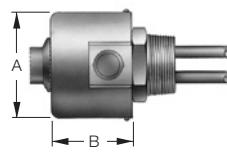

Figure 2

Voltage

Custom built heaters are available in any special voltage rating up to 600V.

Wattage

Heaters listed are standard wattage. Any reasonable wattage is available to replace your present heater with a similar Caloritech™ unit.

Length

Heaters are available with immersed lengths up to 135" (3430 mm).

Internal vessel support must be used when immersed length exceeds 49" (1245 mm).

Plug Sizes and Ratings

Thermon Heating Systems can install elements in virtually any size or rating of plug, special or standard.

Special Materials

Special sheath, plug and terminal box materials are available on request.

Welded Elements

While welded elements are standard for CXI heaters, CXF heaters listed have the elements silver brazed to the plug which suits most applications. Thermon Heating Systems can provide listed CXF heaters with elements welded to the plug.

Built-in Thermostat Well

Built-in thermostat wells are available. Specify length and internal diameter required.

Heaters ordered with explosion-proof or moisture resistant housings have built-in wells as standard.

Passivation

Incoloy® and stainless steel sheathed heaters are available with chemically passivated sheaths which will provide superior corrosion resistance in most applications. Passivation is achieved through an electropolishing technique.

Heaters with stainless steel plugs are available with all wetted surfaces passivated.

Moisture Resistant Terminal Housings

Moisture resistant terminal housings suitable for outdoor applications are available for all heater sizes. See Figure 4 on page B20.

Explosion-Proof Terminal Housings

If the heater is to be operated in a hazardous environment an explosion-proof housing must be used. See Figure 5 on page B20. Specify Class, Div. (or Zone), Group and Temp. Code for the hazardous location.

Domestic Immersion Heaters - CX

Application

Caloritech™ domestic immersion heaters have been developed as high quality replacements for the most commonly used heater types.

In cases where the old style resistor type element is called for, choose a tin or zinc plated element. The plating reduces galvanic current within the tank, thus reducing corrosion and providing a longer heater and tank life. The elements are also epoxy sealed to protect the heater from moisture and other contaminants which could otherwise lead to premature element failure.

Choose a suitable element from the following tables or have your nearest Caloritech™ representative assist you in your selection.

Type AW Replacement Thermostats and Type HLC1610 High Limit Cutout

Type AW thermostats are replacement units for all storage-type domestic water heaters. They are for use with immersion or wrap around type elements and can be screw or clamp mounted.

Type HLC1610 high limit controls are specifically designed for domestic hot water heater protection.

Table 12 – Domestic Immersion Heater Thermostats and High Limit with Manual Reset

Catalog No.	Electrical Rating	Circuit Hop	Temperature	
			°F	°C
AW7025	240V 25 amp Single Pole Single Throw	On Temperature Rise	120 to 180	49 to 82
AW7135	240V 25 amp Single Pole Double Throw	Circuit 1 on Temperature Rise Circuit 2 on Temperature Fall	120 to 180	49 to 82
HLC1610	240V 25 amp Double Pole Double Throw	On Temperature Rise	190 ± 5	88 ± 2.8

Urn Heaters - TX

Application

Type TX immersion heaters are intended for use in steam tables, coffee urns, kettles, sterilizers, percolators and many other water heating applications where a bottom-mount heater is most practical.

The heaters are not guaranteed against corrosion since Thermon Heating Systems has no control over the liquid type, concentration or temperature.

Heaters must be kept free of heavy scale build-up to prolong life. Most importantly, the heating elements must be fully immersed in liquid during operation. Units with built-in low water level cutouts are recommended. Units without cutout will fail under low water conditions. Cutouts are a safety device and should not be relied on as the only form of water level control.

Features

Type TX heater represents a complete redesign of the TTUH unit. All models have an O-ring sealing gasket with elements fully prewired.

The most advanced feature, intended to provide extended life, is the fast response low level trip used on the built-in cutout models. Once the cutout trips (and after the water level is restored) it must be manually reset before the heater will energize.

CAUTION: This limit is not intended to function as a low level control. Repeated use as a low level control will result in premature heater failure.

For heaters which draw over 25 amps, or for three phase heaters, the cutout is intended for pilot duty only and is not factory prewired to the elements.

Installation

After removal of the terminal box and the mounting ring, the heater is inserted from the inside of the tank. A 2.44" (62 mm) diameter opening in the vessel (which is normally of thin walled construction) is required to receive the brass mounting flange.

To insert the heater into a closed or semi-closed tank, an opening at the top or side of the tank is required. Check Table 13 on page B24 for the required size of this hand-hole.

Construction

All units have a brass mounting flange and a copper sensing capillary for the low level cutout (when installed). Heaters without a factory installed cutout can only be retrofitted with a cutout at the factory since a special socket wrench is required for this purpose.

Standard element sheath material is copper. Other materials are available on custom orders. Special wattage and voltage ratings can be ordered.

Table 13 – Hand-Hole Requirements

Heater Type	Hand-Hole Size	
	in.	mm
1 Element	5.125	103
2 Element	5.500	140
3 Element	5.875	150

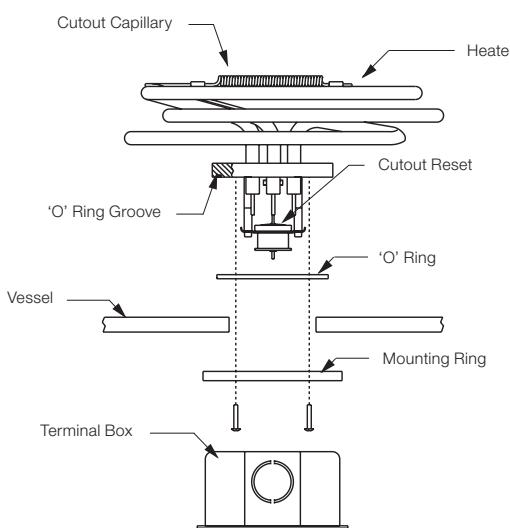

Figure 13 – Urn Heater Diagram

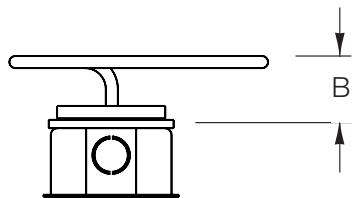

Figure 14 – 1 Element Unit

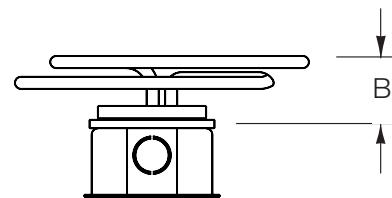

Figure 15 – 2 Element Unit

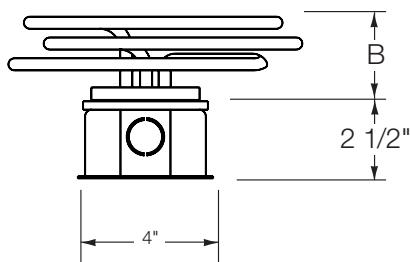

Figure 16 – 3 Element Unit

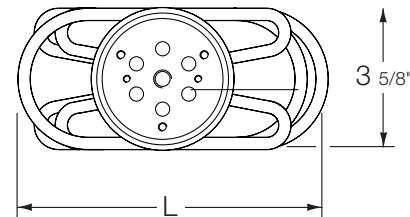

Figure 17 – Bottom View

Selection

Type TXC heaters are primarily for water heating and have copper sheathed heating elements. These units do not have a built-in low level cutout and should only be used where there is no chance that the water level will fall exposing the elements. Elements will fail if not completely immersed.

Type TXCC heaters are similar to the TXC models except that a built-in low level cutout is designed to trip the heater circuit in the event of low water. If there is even the slightest chance of a low water condition, the TXCC should be specified.

Special Sheath

These heaters are available with Incoloy® sheath on special order.

Flange Heaters - CX

Application

Flange heaters are used to heat liquids or gases in tanks or in-line vessels. Safe and reliable service from the heater requires the correct selection of materials and heating element watt density.

Watt Density

Watt density refers to the wattage output of a heater divided by the total surface area of the heated sections of all heating elements in the heater.

It is important to understand the basic thermal difference between an electric immersion heater and a steam or liquid heat exchanger.

Unlike the steam or liquid heat exchanger, all of the heat produced by an electric heater will leave the heater. Even though the surface area in contact with the work is fixed, the heating element sheath temperature will continue to rise until the heat produced is equal to the heat transferred to the process.

A detailed understanding of this behaviour and the system parameters will allow the design of a suitable heater to heat virtually any liquid or gas with the only limitation being its ability to resist corrosion in highly active solutions.

As a general rule, low watt density heaters will provide longer service life than high density heaters, especially when the fluid being heated is viscous or stagnant. However, low density heaters are initially more expensive and in larger systems it is best to check with the factory for assistance in optimizing the heater selection.

See Section D of the Caloritech™ catalog for recommended watt densities for some of the more common fluids.

A final word of caution... improper selection of watt density can result in damage to the product and failure of the heater.

Corrosion

The heaters are not guaranteed against corrosion since Thermon Heating Systems has no control over the type, concentration and temperature of the solution. Our experience is that published corrosion guidelines are based on ideal situations which may prove to be a bit optimistic in actual practice. In some instances there is little alternative other than to accept reduced service life and keep a spare heater on hand as a standby replacement.

Passivation

Incoloy® and stainless steel sheathed heaters are available with chemically passivated sheaths which will provide superior corrosion resistance in most applications. Passivation is achieved through an electropolishing technique.

Heaters with stainless steel flanges are available with all wetted surfaces passivated.

Since passivation is a relatively expensive procedure it should only be specified in highly corrosive applications and on the recommendation of the chemical supplier.

Construction

Standard heaters listed have 150 lb ANSI rated steel flanges and copper or Incoloy® sheathed elements silver brazed to the flange. Heaters pictured on these introductory pages are examples of some of the custom heaters we have produced to meet special process requirements.

It is important to note flange heaters used in closed vessels may require registration as ASME fittings from the pressure vessel authority in the jurisdiction of use. For questions regarding application registration requirements, consult with the factory. Use of a non-registered heater may violate the Pressure Vessels Act depending upon the jurisdiction of use.

Wiring

High amperage heaters allow staging through 45 amp subcircuits to allow the use of 50 amp definite purpose magnetic contactors on each circuit.

Terminal lugs and grounding lugs are provided.

Refer to Section F of the Caloritech™ catalog for wiring and temperature control accessories available from Thermon Heating Systems.

Control

Most systems require some method of temperature and limit control. As heating control specialists we can provide state-of-the-art control systems to meet any process requirements.

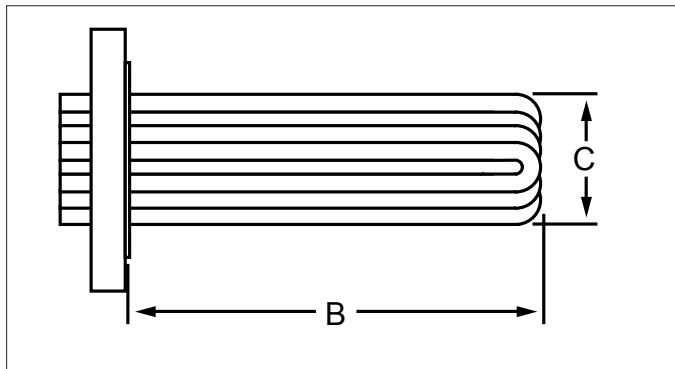

Figure 18 – Element Dimensions

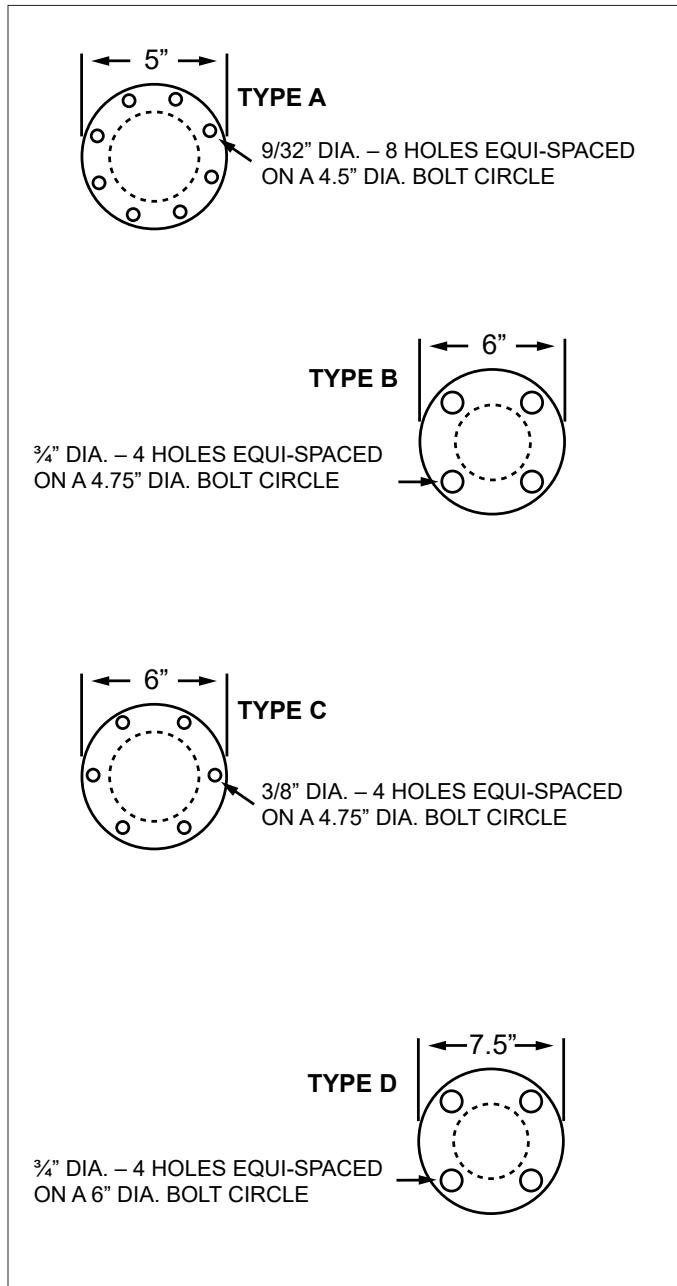

Figure 19 – Flange Type

To Order Specify

To order a custom round flange boiler replacement specify:

- Flange type from Figure 18 on page B27
- Phase
- Kilowatts
- 'B' and 'C' dimensions
- Number of elements
- Voltage
- Number of circuits

If your flange does not match any of these types send us a similar sketch or a description. Include the flange thickness.

2 1/2" Flange Heaters

Selection

Type CXC heaters are used primarily for heating water and have copper sheathed elements silver brazed to a steel flange.

Type CXI heaters may also be used to heat water, especially in hot water and steam boilers. These heaters are also suitable for heating mildly corrosive solutions in rinse tanks, spray washers, etc.

Heaters consist of Incoloy® sheathed elements silver brazed to a steel flange.

Type CXF heaters are constructed of similar materials to CXI heaters except that the heating elements have much lower watt densities. These heaters are especially suited to heating oils, gases and mildly corrosive liquids. Select the lower density CXF heaters for stagnant or heavy oils or for high temperature, low flow gas heating.

8" Flange Heaters

Selection

Type CXC heaters are used primarily for heating water and have copper sheathed elements silver brazed to a steel flange.

Type CXI heaters may also be used to heat water, especially in hot water and steam boilers. These heaters are also suitable for heating mildly corrosive solutions in rinse tanks, spray washers, etc.

Heaters consist of Incoloy® sheathed elements silver brazed to a steel flange.

Type CXF heaters are constructed of similar materials to CXI heaters except that the heating elements have much lower watt densities.

These heaters are especially suited to heating oils, gases and mildly corrosive liquids. Select the lower density CXF heaters for stagnant or heavy oils or for high temperature, low flow gas heating.

Special Features

Voltage

Custom built flange heaters are available in any special voltage rating up to 600V max.

Wattage

Special wattage units are available to replace your present heater with a similar Caloritech™ unit.

Length

Heaters are available with immersed lengths up to 135" (3430 mm). Internal vessel support is recommended when immersed length exceeds 50" (1275 mm).

Extra Heavy Wall Sheath

Standard sheath wall thickness is 0.035" (0.889 mm). Heavy wall sheath with a thickness of 0.049" (1.24 mm) or 0.065" (1.65 mm) is available in Incoloy®, Inconel®, steel and stainless steel sheaths.

Flange Sizes and Ratings

Thermon Heating Systems can install elements in virtually any size or rating of flange, special or standard.

Flexitallic Gasket

Stainless steel flexitallic gaskets are available for all flange sizes.

Special Materials

Special sheath, flange and terminal box materials are available on request.

Passivation

Incoloy® and stainless steel sheathed heaters are available with chemically passivated sheaths which will provide superior corrosion resistance in most applications. Passivation is achieved through an electropolishing technique. Heaters with stainless steel flanges are available with all wetted surfaces passivated.

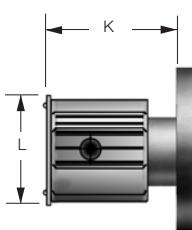

Figure 20

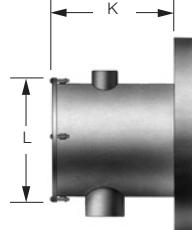

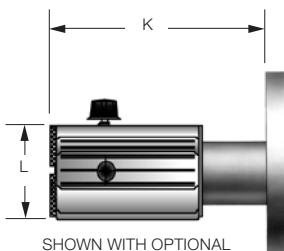

Figure 21

SHOWN WITH OPTIONAL
EXTERNALLY ADJUSTABLE
THERMOSTAT

Figure 22

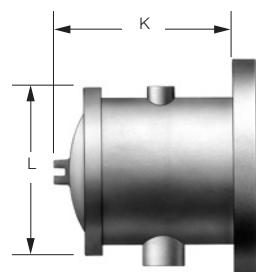

Figure 23

Welded Elements

Standard flange heaters listed have the elements silver brazed to the flange which suits most applications.

Thermon Heating Systems can provide heaters with elements welded to the flange for all sheath materials except copper.

Built-in Thermostat Well

Built-in thermostat wells are available. Specify length and internal diameter required.

Built-in Limits and Thermostats

Built-in high limits and thermostats are available. Standard built-in thermostat is a one pole device limited to 240V 25 amp. Whenever the heater voltage exceeds 240V or the heater current exceeds 25 amps or for three phase supply, the thermostat is intended for pilot duty only and is not factory wired to the elements. See Section F of the Caloritech™ catalog for selection of the contactor and control transformer you may require in these instances.

Built-in Thermocouples

Integrally mounted thermocouples can be provided for sheath limit protection or temperature control of the fluid.

Vented or Stilted Housings

Vented or stilted terminal housings are required in many high temperature applications to ensure that connection wire is not overheated.

Special Terminal Housings

Moisture resistant and/or explosion resistant terminal housings are available for all flange heater types. When ordering an explosion-proof housing specify Class, Div. (or Zone), Group and Temp. Code for the hazardous location. See Figure 20 through Figure 23.

Over-the-Side Immersion Heaters - DX

Application

Side mount immersion heaters are for use in solutions requiring easy removal of heaters for cleaning or inspection.

Single phase or three phase heaters are available. Refer to the Corrosion Guide (Section D) to assist in the selection of the heater most suited to your conditions.

Refer to Section D to select the heater with a watt density suitable to your application. Lower watt densities normally provide longer service life.

Installation

During installation the heated section (See Figure 24 and on page B38) of the heater must always remain totally immersed or the heater may fail.

When determining your minimum liquid level be sure to make allowance for loss of solution volume by evaporation and removal of work.

TYPE DXC - Used mainly for heating water or water solutions which will not corrode copper.

TYPES DXI, DXS - Type DXI heaters are used in water rinse tanks with contaminants which would be corrosive to copper. Type DXS and DXI are also suitable for use in oil based solutions or other chemical solutions which would not be corrosive to stainless or Incoloy®.

TYPES DXN, DXT - These high grade Inconel® or titanium sheathed heaters are frequently used when copper, stainless or Incoloy® sheathed heaters are unsuitable. Check the Corrosion Guide in Section D for further information.

To Order Specify

- Quantity
- Phase
- Catalog number
- Wattage
- Voltage

Note: The type DXT titanium sheathed heater does not have stand-off brackets.

Application

Caloritech™ bottom mount heaters are available as standard in copper or Incoloy® sheaths for use in most liquid heating applications. Check the construction details listed below and also Section D of the Caloritech™ catalog for watt density and sheath selection.

Construction

Types DXLC and DXRC heaters have copper sheathed heating elements silver brazed to a welded 304 stainless steel box and riser.

Types DXLI and DXRI heaters feature high density Incoloy® sheathed heating elements and 304 stainless steel immersed parts in a fully welded construction.

Types DXLF and DXRF heaters feature low density Incoloy® sheathed heating elements and steel immersed parts in a fully welded construction.

Special Features (Ordered Separately)

- Special wattage or voltage
- Special riser height
- Special materials
- Multiple rows of elements for higher wattages
- Built-in thermostat or high limit controller
- 4" (102 mm) sludge legs
- Passivation for Incoloy® and stainless steel sheath
- Explosion-proof construction

Pipe-Insert Immersion Heaters - MX

Application

For heating asphalt, molasses, tar, paint, glue or any viscous fluids. When heating corrosive liquids the pipe enclosing the heater must be resistant to corrosion. Tank fabricator to supply and install pipes. Heater can be removed without draining the liquid.

Heat is transferred safely from the heating element to the inner wall of the pipe by a combination of convection and radiation. Note that filling the pipe with a heat transfer fluid is neither required nor recommended.

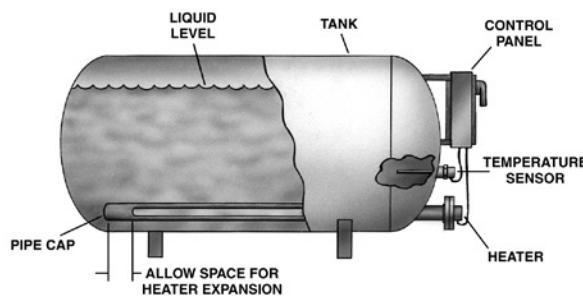

Figure 28 – Typical application of pipe-insert immersion heater for viscous fluids

Construction

Standard heaters have heavy duty alloy sheathed element(s) fitted to either a 3" 150 lb. steel flange or a 2" NPT screwplug. The terminal box is moisture resistant for outdoor applications. One 1" NPT conduit fitting is provided on units without thermocouple, and an additional 1/2" NPT conduit fitting is provided on units with built-in thermocouples.

Heaters with Type K thermocouples (one per tank) are used for detecting low liquid levels. If the level drops below the uppermost heater, the temperature inside the heater pipe will rise. The thermocouple will detect this temperature rise, and, when this signal is fed through an electronic temperature limit control, it will automatically trip the system off. Thermon Heating Systems can provide a packaged control panel or ship the control components individually.

Refer to Section D for information on Caloritech™ control panels for this application.

Refer to Section F for information on thermostat and thermocouple assemblies with attached wells.

Installation

Install heaters in a suitable metal pipe with a 2" (51 mm) minimum inside diameter. Fit 3" standard pipe flanges or 2" (51 mm) couplings where pipes extend outside the tank wall and cap the pipe ends inside the vessel.

It is best to leave one pipe a few inches higher than the others. This pipe will receive the heater with the built-in thermocouple or limit device to provide fast response under low liquid level conditions.

Selection and Sizing

Use the graphs (Figure 29 and Figure 30) and the explanation on the following page to determine the kilowatts necessary to maintain the tank at the required temperature. Next, select the required number of heaters with an insert length long enough to provide good heat distribution.

Normally the one element and two element style heaters are used in groups of three so that they can be wired in a three phase balanced system.

When the application entails heating an extremely viscous liquid from a cold start, the one element heater should be selected since the lower resulting watt density on the pipe surface will prevent coking (see Table 38 on page B40).

Table 38 –Watt Density on Pipe Surface vs. Heater Type

Pipe Size		Element Type					
in	mm	1	2	3	1	2	3
		W/in ² on Pipe			W/cm ² on Pipe		
2	51	5.5	7.4	6.8	0.9	1.1	1.1
2 1/2	64	4.6	6.2	5.7	0.7	1.0	0.9
3	76	3.8	5.1	4.7	0.6	0.8	0.7
4	102	3.0	4.0	3.7	0.5	0.6	0.6

Special Features

- Packaged control systems
- Special voltage
- Special wattage
- Explosion resistant terminal housings
- Built-in thermostats/limits
- Special lengths
- Special flange or screwplug sizes
- Extra conduit fittings

Solving Heating Problems: Figure 29 through Figure 31

Step 1: Use tank diameter and length and Figure 29 to determine tank surface area.

Step 2: Using Figure 30, surface area, and maximum design temperature difference between tank contents and surroundings, the heat loss can be determined for 2" (51 mm) or 4" (102 mm) of insulation.

Step 3: Figure 31 for asphalt or heavy oil, is used to determine the additional energy required for heat-up from a cold start if cold loads are added. Use maximum heat-up times to minimize installed kW requirements.

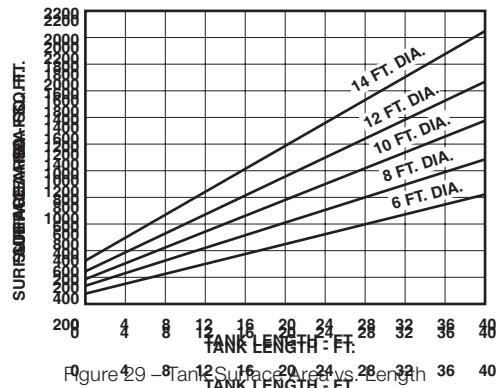

Figure 29 – Tan Surface Area vs. Length

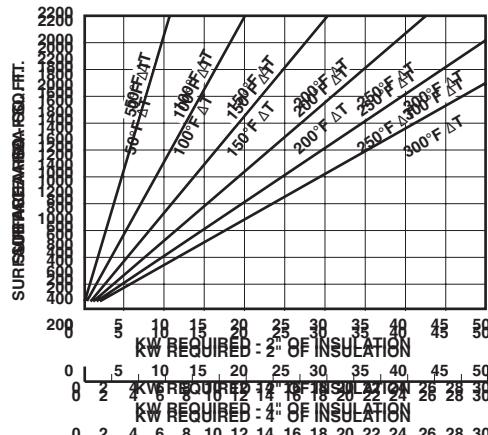

Figure 30 – Tank Surface Area vs. KW Required (installed Kilowatts)

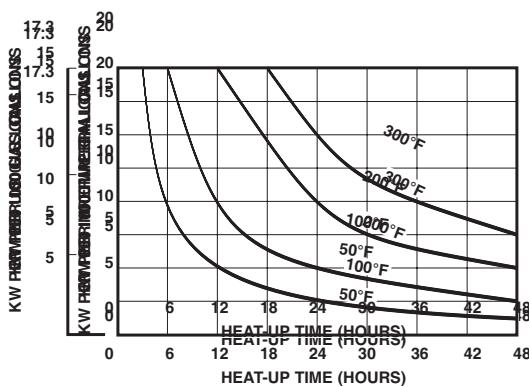

Figure 31 – Tank Capacity vs. Heat-Up Time for Asphalt

Control Systems

Thermon Heating Systems manufactures standard and custom designed control panels for pipe insert heating systems. See Section D for listings of CPA, CPB and CPP panels.

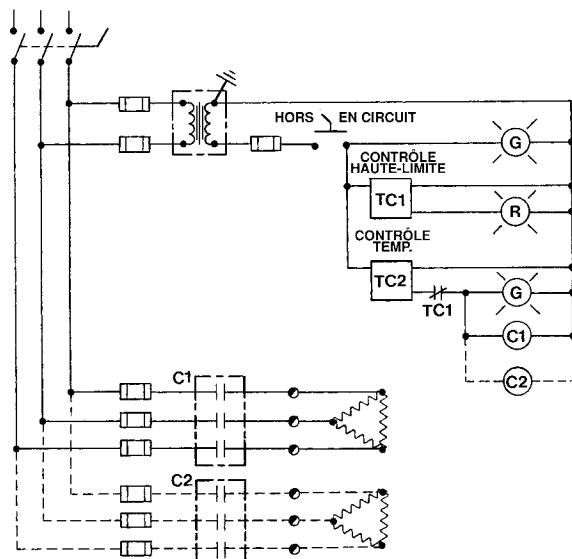

Figure 32 – Typical Control System

Special Pipe Heaters Assemblies

Some applications may require a higher kW rating than can be achieved with individual pipe heaters. Special assemblies of closely spaced pipes mounted to a common header are available. Each pipe in the header is fitted with a special heating element.

Another advantage of this system is that, in the event that an element has to be removed for servicing, draining is not required.

This type of heater is particularly suitable for suction heating in large bunker oil storage tanks.

Pipe-Insert Heaters MX Series

Pipe-insert heaters are listed with a choice of flange or screwplug mount. Special mounting types and sizes are available on request.

Many storage tanks containing high viscosity liquids require a method of heating which will uniformly distribute the heat and will not cause charring or coking. Electric insert heaters installed in pipe wells with large surface areas in contact with the product have proven to be a cost effective and virtually maintenance free solution to these heating problems.

Application

Heat transfer in liquids is mainly by convection as opposed to conduction. Because of their high viscosities, heavy liquids such as asphalt, molasses, tar, paint, wax and some oils have poor heat transfer at low temperatures.

If these liquids require heating, careful consideration must be given to the rate at which heat is being introduced into the product since coking of the liquid at the heating surface could spoil the entire tank contents. Electric pipe-insert heaters eliminate the need for high maintenance pumps or open flames which may present a fire hazard, especially when the liquid being heated is flammable.

Refer to page B40 and page B41 for detailed information on the construction and use of pipe-insert heaters. Table 38 on page B40 gives the resultant watt density (watts per sq. in. of surface area) on 2" (51 mm) to 4" (102 mm) pipes when fitted with any one of the three basic heater types offered.

When heating highly viscous liquids select a pipe size large enough to match the pipe surface watt density with the ability of the liquid to carry the heat away. Table 38 on page B40 gives an explanation of watt density which also applies to pipe heater pipe well surfaces.

Built-in Thermocouples and Thermostats as Limit Devices

If there is even the slightest chance that the liquid level could fall below the uppermost surface of any pipe well, an overtemperature control is recommended. Units listed with built-in thermocouples are intended for use with a Caloritech™ control system.

Explosion-Proof Housing With Externally Adjustable Thermostat For Limit Sensing

Figure 33

The Type MXI heater can also be factory fitted with a built-in thermostat as a limit device with the sensing bulb installed in a thermostat well.

Note that the temperature inside the pipe is much hotter than the pipe itself and varies with the system parameters. It is recommended that you consult the nearest Thermon Heating Systems sales office for assistance with the thermostat selection.

Construction

The heaters are available with single hairpin element, double hairpin elements, or three straight elements. The double hairpin element type can be wired in single phase or three phase, open delta. The three element type is suitable for three phase wiring only.

The heaters can be coiled to a six-foot diameter to permit installation or removal where space restrictions exist.

Special Features

- Special voltage
- Special wattage
- Explosion resistant terminal housings
- Built-in thermostats/limits
- Special lengths
- Special flange sizes
- Extra conduit fittings
- Control systems

Flanged Pipe Heaters - FPH

Caloritech™ FPH Series Flanged Pipe Insert Heaters consist of closely spaced insert pipes mounted to a common flange. Each pipe in the flange is fitted with an independent heavy duty alloy sheathed heating element. The insert pipes and flange provide the heater with a sealed installation, keeping the elements from contacting the fluid in the tank. Heater elements are individually removable in the event of servicing without draining the tank.

The FPH is suited to applications requiring a higher kW rating than can be achieved with individual pipe insert heaters. This type of heater is particularly suitable for liquid heating applications requiring low watt densities such as in large bunker oil storage tanks.

Application

Flanged pipe heaters are uniquely designed to heat storage tanks containing highly viscous, corrosive or heat sensitive materials.

High viscosity, heavy liquids such as asphalt, molasses, tar, paint, wax and some oils have poor heat transfer at low temperatures.

For these liquids, careful consideration must be given to the rate of heat transfer into the product since boiling and coking of the liquid at the heating surface can occur, spoiling tank contents and shortening heater life.

FPH heaters are specifically engineered to reduce overall watt density by maximizing pipe surface area. The large surface area allows for greater kW ratings while maintaining low surface temperatures and controlled heat transfer.

Construction

Standard heaters listed utilize 2", 2 1/2" or 3" SCH.40 steel pipe welded to a 150 lb ANSI rated steel flange. Stainless steel construction is available depending on the application. Heater sizes and ratings are specified based on flange layouts maximizing pipe surface area.

FPH heaters use heavy duty alloy sheathed elements fitted to a 2" or 2 1/2" NPT screwplug for single pipe insert heaters or networked inside the terminal box for units with multiple pipe inserts. Heaters are available

with single hairpin elements, double hairpin elements, triple hairpin elements or three straight elements.

Moisture resistant and/or explosion resistant terminal housings are available for all flanged pipe insert heater sizes.

Caloritech™ manufactures standard and custom designed control panels, engineered to match the specific requirements of tank heating systems. See Section D for listings of CPA, CPB and CPP panels.

Special Features

- Custom voltage
- Custom wattage
- Custom Materials
- Explosion resistant terminal housings
- Built-in thermostat/limits
- Custom lengths
- Various flange sizes
- Control systems
- Partial U-stamp
- Watt densities available below 5 W/in²

Selection

Flanged pipe insert heaters are listed in ascending flange size. Three specific watt densities are listed although additional watt densities are available through special order.

Flanged pipe insert heaters should be selected based on required heating load, flange size, pipe insert length and the maximum watt density for the application.

Standard heaters are constructed with a moisture resistant terminal housing. Optional explosion resistant terminal housings are available.

Gain & Gate Heaters - MXS & WXS

Gain & Gate Guide Heater

Application

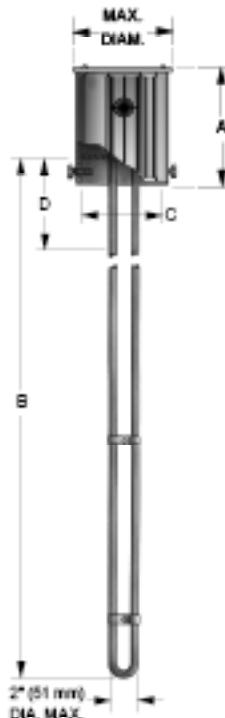

These heaters are specifically designed to prevent ice build-up on sluice gate guides or bodies. The heater is usually installed in a vertical well or duct of round or square cross section having a round nozzle at the top for fastening.

Construction

The heaters are available in single or dual wattage, customized to specifically suit the application.

The heating elements are silver brazed into a water tight terminal housing having recessed base for mounting. Element ends are hermetically sealed to prevent moisture ingress over prolonged periods when the heaters are not in service.

Unlike open wire heaters with ceramic supports, Type MXS heaters can be coiled to a six foot diameter to facilitate shipping and handling.

To Order Specify

Voltage and Wattage - wattage may range from 6 to 18 watts per linear inch depending on the conditions. For extra long heaters, utilize 480V or 600V to ensure that the heater can be built. If dual wattage is required, specify details.

Terminal Box - check the dimensions of the standard terminal box shown in the figure above, depicting the MXS series heater, for suitability. Other sizes and types are available.

Heating Element Dimensions - indicate insert length "B" and non-heated section D. Allow 2% for manufacturing tolerance plus heater expansion when specifying "B" dimension.

Gate Body Duct Heater

Application

Gate body duct heaters are custom engineered by CCI Thermal to heat the inside of the gate and prevent ice build-up on the gate walls, wind seals and end members.

The heaters can be connected to a duct having outlets at various elevations within the gate.

Construction

Gate body duct heaters feature a weather proof duct heater and matched motor and high static axial fan assembly installed within a galvanized heavy steel housing.

Heating elements are hermetically sealed to prevent moisture ingress over prolonged periods when the heaters are not in service.

Various control options are available such as ambient temperature sensing thermostat, outlet air temperature thermostat, limit control and differential pressure switch. Designs are available from 4 kW to 120 kW.

To Order Specify

Voltage, phase and wattage plus control options.

Also specify static pressure requirements of the fan assembly at the design air flow and the duct diameter.

Note that CCI Thermal also builds control panels for sluice gate heating control (see Section D).
